

**An Object-Oriented Finite Volume Framework
and its Application to Fluid Dynamics Problems**

Von der Fakultät für Ingenieurwissenschaften, Abteilung Maschinenbau der
Universität Duisburg-Essen
zur Erlangung des akademischen Grades

DOKTOR-INGENIEUR

genehmigte Dissertation

von

Oliver Gloth

aus

Mülheim an der Ruhr

Referent: Prof. Dr.-Ing. D. Hänel
Korreferent: Prof. Dr. A Dervieux
Tag der mündlichen Prüfung: 10.01.2003

Acknowledgments

The research project that lead to this work has been funded by the *DFG (Deutsche Forschungsgesellschaft)*.

The developments, forming the basis of this work, have been made during my employment at the *Institute for Combustion and Gas-Dynamics* at the *University of Duisburg*. Therefore I would like to thank the head of the institute Prof. Dr.-Ing. P. Roth and all institute staff at the time for the pleasant working-environment and for many interesting discussions .

Particular thanks, of course, go to my supervisor and head of the computational fluid dynamics section, Prof. Dr.-Ing. D. Hänel. Furthermore I would like to thank Dr. R. Vilsmeier for his continuous support and cooperation during the whole time. Special thanks go to I. Wlokas, for the outstanding computer environment we enjoyed and for the patience he proved to have at times.

The work has been funded as part of a joined project between *INRIA, projet SINUS, Sophia Antipolis, France* and the *Institute for Combustion and Gas-Dynamics*. I would like to thank all *INRIA* people at the time for welcoming me during my three months stay in Sophia Antipolis. Particularly I would like to thank Prof. Dr. A.Dervieux for accepting to be in the committe. Many thanks also to L. Fournier for the good cooperation in the field of multi grid methods on unstructured grids.

Last but not least many thanks go to my parents for their support.

Noordwijk, The Netherlands
in the summer of 2003

Contents

1	Introduction	1
2	Mathematical Models	3
2.1	Generic Form of Partial Differential Equations	3
2.2	Compressible Navier-Stokes Equations	4
2.2.1	Fluxes	4
3	Numerical Techniques	7
3.1	Grid Structure	8
3.1.1	Structured Grids	9
3.1.2	Block Structured Grids	10
3.1.3	Cartesian Grids	10
3.1.4	Chimera (Overlaying) Grids	11
3.1.5	Triangular Grids	11
3.1.6	Unstructured Hybrid Grids	12
3.2	Finite Volume Discretization	13
3.2.1	Different Control Volume Constructions	15
3.2.2	Discretized Surface Integrals	17
3.2.3	Discretized Gradients	21
3.2.4	Variable Reconstruction	22
3.3	Time Integration	23
3.3.1	Explicit Time Stepping	24
3.3.2	Convergence Acceleration	26
3.3.3	Generic Numerical Algorithms	28
3.4	Flux Formulations for Compressible Flow	29
3.4.1	Inviscid Fluxes	29
3.4.2	Viscous Fluxes	31
4	Mesh Generation	35
4.1	Generation of Unstructured Simplex Grids	35
4.1.1	Initial Triangulation	35
4.1.2	Mesh Optimization	36
4.2	Mesh Generation Based upon Level-Sets	39
4.2.1	Non Body-Conformal versus Body-Conformal Grids	39

4.2.2	Geometry Description	41
4.3	Isotropic Mesh Generation	42
4.4	Creation of Quad-Layers	45
4.5	Different Input Types	46
4.6	Moving Boundaries	48
4.6.1	Two Moving Circles	48
4.6.2	A Rotating and Deforming Shape	49
5	Multi-Grid on Unstructured Grids	53
5.1	Basic Idea of Multi-Grid Methods	54
5.2	Linear Multi-Grid	56
5.2.1	Transfer Operators	57
5.2.2	Ideal Two Grid Cycle	58
5.2.3	The Standard V-Cycle	59
5.3	The FAS method	59
5.3.1	Runge-Kutta Scheme for Smoothing	62
5.4	Construction of Mesh Sequences	63
5.4.1	Optimizing the Shape of Agglomerated Cells	64
5.5	Higher Order Spatial Discretization	65
5.6	Boundary Conditions	66
5.7	Inter-Grid Operators	67
5.8	Impact of the Agglomeration Quality on the Convergence	67
6	Object-Oriented Techniques and Numerics	71
6.1	Brief Introduction	72
6.2	Classes and Inheritance	72
6.3	Encapsulation	73
6.4	Polymorphism	75
6.5	A Simple Numerical Example	76
6.5.1	Dynamic Polymorphism (Virtual Function)	78
6.5.2	Static Polymorphism (Templates)	79
6.5.3	Combination of Static and Dynamic Binding	80
6.5.4	Comparison	82
7	Design of an OO/FV Library	83
7.1	General Concepts	84
7.1.1	Main Programming Interfaces	85
7.1.2	Data Storage Classes	88
7.1.3	Constructor Call Mechanism	92
7.2	Implementation of New Control-Commands	95
7.3	Implementation of New Numerical Operators	104
7.3.1	Solving the Linear Wave Equation in 2D	104
7.3.2	Simulating a Non-Linear Convection Problem in 3D	106

8	Numerical Experiments	111
8.1	Lid Driven Cavity Flow (2D)	111
8.2	Two-Dimensional Flow Around Airfoils	115
8.2.1	Accuracy Tests for Inviscid Flow	115
8.2.2	Viscous Flow Around a Selig/Donovan SD8000 Airfoil	118
8.2.3	Inviscid, Transsonic Flow Around an RAE2822 Airfoil	119
8.3	Inviscid, Transsonic Flow Past an ONERA-M6 Wing	121
9	Conclusions and Perspectives	125
9.1	Summary	125
9.2	Critical Review of Design Criteria	126
9.2.1	Programming Interface and Flexibility	126
9.2.2	Efficiency	126
9.2.3	Reuseability	127
9.3	Maintainability	127
9.4	Projects Using the Software	127
9.4.1	Simulation of Ship-Flow	128
9.4.2	Nano Sized Particles	129
9.4.3	Unstructured Lattice Boltzmann Schemes	129
9.4.4	Tracking of Discontinuous Solutions	129
9.5	Future Perspectives	130
A	Notation and Mathematical Symbols	131
A.1	Notation	131
A.1.1	Indices	131
A.1.2	Unknowns of Partial Differential Equations	132
A.1.3	Special Notations	132
A.2	Symbols	133
A.2.1	Indices	133
